

Efficiency with Office 365

Important success factors for using Office 365 as an efficient intranet solution platform.

The on premise market considers best practice approaches when implementing SharePoint solutions.

With Office 365 respectively with SharePoint Online, those best practice approaches are still increasingly valid:

- The MasterPage is off-limits.
- Design adjustments for PageLayouts need to be implemented using HTML5-/ CSS-Injection.
- Navigation display needs to be implemented using SharePoint "Current Navigation Provider".
- The use of standard functions is required - enhancements need to be implemented as AddIn (App Model).

By adhering to these simple rules, implementation and operating costs can be reduced.

Further benefits are:

- Ensuring compatibility with Microsoft Office 365 upgrades.
- Cost-efficient and full responsive Office 365 Solution.
- Reduction of training costs.

Customers already tried to achieve the advantages offered by Office 365 solution in their on premise environment.

But instead of following the Pareto Principle customized SharePoint solution with little cost-benefit and high follow-up costs like migration costs were implemented.

Office 365 – creates a unique opportunity to implement efficient solutions. This also provides excellent arguments for discussion with the business.

We support you in making your Office 365 environment an efficient and cost-effective intranet platform.
